IMPORT DATA USING TRANSFORM MAPS (SPREADSHEET)

SCENARIO

Importing employee information from a spreadsheet into ServiceNow using **Import Sets and Transform Maps**.

Steps	Employee Data Import Process
Start	The administrator prepares an employee spreadsheet containing Employee ID, Name, Email, Department, and Location.
Upload Spreadsheet	The spreadsheet is uploaded into ServiceNow using the Import Set feature.
Import Set Table	The uploaded employee data is temporarily stored in an Import Set Table for processing and validation.
Validate Data	The imported records are checked to ensure that the employee information is correctly available for transformation.
Create Transform Map	A Transform Map is configured to connect the spreadsheet fields with the corresponding fields in the target Employee table.
Field Mapping	Employee ID, Name, Email, Department, and Location are mapped to their corresponding Employee table fields.
Identify Existing Employees	Employee ID is used as the unique identifier to check whether an employee already exists in the Employee table.
Update Existing Record	If the Employee ID already exists, the corresponding employee record is updated with the imported information.
Insert New Record	If the Employee ID does not exist, the employee information is inserted as a new record in the Employee table.
Complete Import	The Transform Map processes the data and completes the import of employee records into the target Employee table.
Verify Records	The administrator verifies that both updated and newly inserted employee records contain the correct information.
End	Employee information from the spreadsheet is successfully imported, updated, or inserted into the Employee table.

Interactions

Things: Employee spreadsheet; Import Set Table; Transform Map; Employee Table; ServiceNow interface.
People: ServiceNow Administrator; Employee / User.
System interactions: Upload spreadsheet; store data in Import Set Table; validate imported data; map spreadsheet fields; identify existing employees using Employee ID; update existing records; insert new employee records.

Goals & Motivations

• Help me import employee information easily from a spreadsheet.

• Help me validate employee data before updating the target table.

• Help me identify existing employees using Employee ID.

• Help me update existing employee records automatically.

• Help me insert new employees without creating duplicate records.

• Help me maintain accurate employee information in ServiceNow.

Positive Moments

• Spreadsheet data can be imported in bulk.

• Employee fields can be mapped using a Transform Map.

• Existing employees can be identified using Employee ID.

• Existing records are updated automatically.

• New employees are inserted as new records.

Negative Moments

• Incorrect spreadsheet data may cause import problems.

• Incorrect field mapping can affect employee records.

• Missing Employee IDs can make identification difficult.

• Duplicate or invalid data may require validation.

Areas of Opportunity

• Improve spreadsheet data validation before importing.

• Ensure all required fields are correctly mapped.

• Use Employee ID consistently as the unique identifier.

• Verify updated and newly inserted records after transformation.

• Reduce manual data entry and avoid duplicate employee records.

Exit / Final Result

The employee spreadsheet data is successfully processed through the **Import Set Table** and **Transform Map**. Existing employees are updated using **Employee ID**, while new employees are inserted as new records into the **Employee Table**.
