Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	

Solution Architecture:

Solution ArchitectureImport Data using Transform Maps (Spreadsheet) is a process in ServiceNow that bridges the gap between spreadsheet-based employee data and the target Employee table. It uses Import Sets and Transform Maps to temporarily store, validate, transform, and load employee information into the system. Its goals are to:

- Import employee information from a spreadsheet into ServiceNow using Import Sets.
- Store and validate the uploaded employee data in an Import Set Table before transferring it to the target Employee table.
- Map employee fields such as Employee ID, Name, Email, Department, and Location from the spreadsheet to the corresponding fields in the Employee table.
- Identify existing and new employees using Employee ID as the unique identifier, so existing records are updated and new employees are inserted as new records
